(57) **ABSTRACT**

A skateboard tool system (100) may comprise a first arm (200), a second arm (300), a third arm (400) attached to a body (500) with each arm forming an overall “T” shape and each arm having a distal end attached to a useful implement. To gain mechanical advantage, the body (500) may contain or be integrated with a rethreading tool (540). The centralized location of the re-threading tool in combination with the “T” shape allows for a superior purchase or grip while rotating the re-threading tool. The body may define various voids to comport with a unique “L” shaped screw driver (600), the screw driver having a shorter (605) and a longer (607) longitudinal member giving additional leverage in rotating a Phillip head screw driver (610). A cutting blade is retained within the body for ease of access and safety.

## SKATE TOOL

## CROSS-REFERENCE TO RELATED APPLICATIONS

This is a utility application based upon and claims priority from U.S. patent application Ser. No. 62/195,379 filed on Jul. 22, 2015. This related application is incorporated herein by reference and made a part of this application. If any conflict arises between the disclosure of the invention in this utility application and that in the related provisional application, the disclosure in this utility application shall govern. Moreover, the inventor(s) incorporate herein by reference any and all patents, patent applications, and other documents hard copy or electronic, cited or referred to in this application.

## BACKGROUND OF THE INVENTION

## (1) Field of the Invention

The invention generally relates to tool systems. More particularly, the invention relates to means and methods of creating a multi-purpose tool useful with skateboards.

## (2) Description of the Related Art

While other skate board tools are known, the known related art fails to anticipate or disclose the principles of the present invention.

In the related art, the general idea of a multipurpose skate tool is disclosed in U.S. Pat. No. 7,127,766 granted to Carter on Oct. 31, 2006. The Carter tool discloses a bulky five armed body that is difficult to transport.

U.S. Pat. No. 6,279,434 granted to Brown on Aug. 28, 2001 discloses a tool in the general shape of a "T" and is marginally equipped with rudimentary tool ends. The Brown tool has a "T" shape body having a crossbar bisected by a stem and provides for three sockets of differing sizes, each socket mounted at each end of the crossbar and the free end of the stem. Brown includes a combination Allen key and Phillips head screwdriver and a standard Allen wrench having a long arm and a short arm perpendicular to the long arm. The Brown tool fails to provide tool implements necessary for today's skateboarding enthusiasts.

U.S. Pat. No. D622,561 granted to Brown on Aug. 31, 2010 discloses a "T" shaped tool with a ratcheting arm; however, Brown fails to disclose or suggest the use or storage of a folding blade or multi-purpose screwdriver.

Thus, there is a need in the art for the presently disclosed embodiments.

## BRIEF SUMMARY OF THE INVENTION

The present invention overcomes shortfalls in the related art by presenting an unobvious and unique combination and configuration of methods and components to provide a plethora of tools within a compact format. Disclosed embodiments present an unobvious improvements and advantages over the current tools of the related art.

The invention overcomes shortfalls in the related art by providing an efficient form factor and providing a blade or other edge component to cut grip tape, a re-threading tool, a ratchet arm with a ratchet selector switch, a metal file, and "L" shaped screw driver providing enhanced leverage.

Embodiments of the invention may also include the use of a plastic cover in the shape of a "T" to increase applied

leverage and tool longevity. Embodiments may be used for assembling, disassembling and repairing skateboards while in a skating environment where traditional tools are not found. Disclosed embodiments may comprise three arms or protrusions, two being short arms and one long arm that bisects the short arms, composing a "T" shape.

A face of the tool may feature a rethreading die is in the center. Below the rethreading die, a socket switch is disposed in order to operate the ratcheting arm, the ratcheting arm being the longest arm of the three. An opposite side may contain a removable "L" shaped screwdriver and a small folding or retracting blade.

A disclosed screwdriver may comprise a long end having a Phillips head and a short end having an Allen head. The screwdriver is placed horizontally in the short arm with the Allen head inserted in the fitting. A knife or sharp edge implement is embedded in the same arm just below the screwdriver, resembling a pocket knife.

Disclosed embodiments overcome shortfalls in the art as the disclosed embodiments facilitate all procedures for preparing new skateboards and for repairing well used or "broken in" skateboards. In one disclosed embodiment, a main body includes a ratchet-like arm that assembles skateboards faster. Moreover, a folding knife included and may be used for cutting grip tape. Included screwdriver implements may be used to secure a board with turning axles; as they are held together by the nuts and bolts. A face contains a die for re-threading worn axles.

These and other objects and advantages will be made apparent when considering the following detailed specification when taken in conjunction with the drawings.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 depicts an isometric view of a disclosed skate tool, showing a die and a T-switch

FIG. 2 depicts a front view of a disclosed skate tool

FIG. 3A depicts a rear view of a disclosed skate tool, showing a blade and screwdriver

FIG. 3B depicts a side view of a screwdriver that may be integrated into a disclosed embodiment

FIG. 3C depicts a side view of a disclosed blade that may be integrated into a disclosed embodiment

FIG. 3D depicts an isometric view of a disclosed embodiment having a folding blade and screwdriver

FIG. 3E depicts an isometric view of a disclosed embodiment with voids sometimes used to store a folding blade and screwdriver

FIG. 4 depicts a side view of a disclosed embodiment

FIG. 5 depicts a side view of a disclosed embodiment

FIG. 6 depicts a top view of a disclosed embodiment

FIG. 7 depicts an end view of a disclosed embodiment

## REFERENCE NUMERALS IN THE DRAWINGS

- 630** Allen head of screw driver **600**
- 700** blade or other edge implement
- 710** pin void of blade **700** or other means of rotation upon a body **500**

#### DETAILED DESCRIPTION OF EMBODIMENTS OF THE INVENTION

The following detailed description is directed to certain specific embodiments of the invention. However, the invention can be embodied in a multitude of different ways as defined and covered by the claims and their equivalents. In this description, reference is made to the drawings wherein like parts are designated with like numerals throughout.

Unless otherwise noted in this specification or in the claims, all of the terms used in the specification and the claims will have the meanings normally ascribed to these terms by workers in the art.

Unless the context clearly requires otherwise, throughout the description and the claims, the words "comprise," "comprising" and the like are to be construed in an inclusive sense as opposed to an exclusive or exhaustive sense; that is to say, in a sense of "including, but not limited to." Words using the singular or plural number also include the plural or singular number, respectively. Additionally, the words "herein," "above," "below," and words of similar import, when used in this application, shall refer to this application as a whole and not to any particular portions of this application.

The above detailed description of embodiments of the invention is not intended to be exhaustive or to limit the invention to the precise form disclosed above. While specific embodiments of, and examples for, the invention are described above for illustrative purposes, various equivalent modifications are possible within the scope of the invention, as those skilled in the relevant art will recognize. For example, while steps are presented in a given order, alternative embodiments may perform routines having steps in a different order. The teachings of the invention provided herein can be applied to other systems, not only the systems described herein. The various embodiments described herein can be combined to provide further embodiments. These and other changes can be made to the invention in light of the detailed description.

Any and all the above references and U.S. patents and applications are incorporated herein by reference. Aspects of the invention can be modified, if necessary, to employ the systems, functions and concepts of the various patents and applications described above to provide yet further embodiments of the invention.

FIG. 1 an embodiment **100** comprising a first arm **200**, a second arm **300** and a third arm **400**. The three arms may be joined or be integral to a main body **500**, with the main body covered with a cover **520**, the cover **520** sometimes made of plastic. The cover **520** may be attached to or integrated with an end cap **525**. The body **500** may comprise a re-threading tool **540** and the body may comprise an internal ratchet

system (not shown) connected with the third arm **400**. The internal ratchet system may be controlled by an external T switch or ratchet selector switch **560** found upon the main body **500**. The third arm **400** is shown with an end socket **430** and the second arm **300** is shown with an end socket **330**. The end socket **430** of the third arm may be a  $\frac{3}{8}$  inch socket while the end socket **330** of the second arm may be a  $\frac{1}{2}$  inch socket. The first arm **200** may have a socket **230** (shown in FIG. 4) of a size of  $\frac{9}{16}$  inch.

The T switch or ratchet selector switch **560** may control the rotational force of the rotating third arm **400** and connected socket **430** with the connected socket **430** sometimes used in assembling trucks or turning axles.

The re-threading tool **540**, in one embodiment, may be used while disposed to the first arm **200**.

A disclosed body **500** may include a ratchet-like arm **400** for assembling skateboards efficiently, decreasing set-up time. A disclosed embodiment may comprise a T switch **560**, enabling the tool to rotate clockwise or counter-clockwise.

When the grip tape is applied, the screw driver, equipped with a metal file, is used to trace the shape of the board before cutting; the blade will be used to cut the grip tape. The face contains a die for re-threading axles, which prevents stripping the nuts that screw on the axles. Overall, "T" shape enables the user to work resourcefully, providing significant leverage while operating a disclosed embodiment.

FIG. 2 depicts various features such as the first arm **200**, second arm **300** and third arm **400**. More particularly, FIG. 2 depicts a cover **520** of the main body, a re-threading tool **540**, a T switch **560** or ratchet selector switch, the switch sometimes used to control the rotational force of the third arm **400**. The distal end of the third arm **400** may comprise an end socket **430**. An endcap **525** may be disposed at the inferior end of the cover **520**.

FIG. 3A depicts a back side of a disclosed embodiment **100** comprising a retained "L" shaped screw driver **600** and blade **700**. The "L" shaped screw driver **600** may be retained within a void **523** within the main body.

FIG. 3B depicts an "L" shaped screw driver **600** which may comprise a Phillips head **610** and an Allen head **630**. The "L" shaped screw driver **600** overcomes shortfalls in the art by providing leverage and compact storage into the body of the tool. Extra useful leverage is obtained by having the Phillips head **610** at the distal end of the longer longitudinal member **607** of the "L" shaped screw driver and by having the Phillips head **630** at the distal end of the shorter longitudinal member **605** of the "L" shaped screw driver. The disclosed "L" shaped screw driver **600** overcomes shortfalls in the art, as extra leverage may be applied to the Allen head **630** by virtue of the longer longitudinal member **607** being disposed at or near a right angle from the Allen head **630**.

FIG. 3C depicts blade **700** or other edge implement. A blade may be pivotally connected to a body **500** by use of a pin void **710** or other means of rotation. Blade rotation is shown in FIG. 3D.

FIG. 3D depicts a blade **700** in rotation or hinged attachment to a body **500** of a disclosed tool **100**. FIG. 3D also depicts an "L" shaped screw driver **600** being removed from a body **500**.

FIG. 3E depicts an alternative "L" shaped screw driver void **570** and blade void **580** with the voids defined within the body **500** and or cover **520**. Such voids overcome shortfalls in the art by providing useful tools without increasing the form factor of the invention. An "L" shaped screw driver may be retained in a first void **523** as shown in

5

FIG. 3A or in an alternative void 570, as shown in FIG. 3E. FIG. 3E further depicts a blade void 580 defined within the tool.

FIG. 4 depicts a socket 230 of the first arm 200 and related components. FIG. 4 depicts an embodiment 100 comprising an “L” shaped screw driver 600, a blade 700, a cover 520 and endcap 525. The endcap 525 overcomes shortfalls in the art by providing a two piece (when used with the main cover 520) transition from a main body large circumference to a smaller circumference to comport with the diameter of the third arm 400.

FIG. 5 depicts a socket 330 of the second arm 300 and related components.

FIG. 6 depicts a top view of a disclosed embodiment that may include a cover 520 upon or around the body. FIG. 6 further depicts a re-threading tool 540, the top part of void 523 to accept an “L” shaped screw driver. FIG. 6 further depicts a first arm 200 and a second arm 300.

FIG. 7 depicts an end view showing the details of a third arm 400 which may include a socket 430 or similar implement.

Disclosed embodiments may include the following items.

Item 1. A skateboard tool, the tool of a “T” shape, the tool comprising a body and three arms, with each arm comprising a socket or other work piece, the body attached to or comprising a re-threading tool, the body containing an “L” shaped screw driver and a blade, the “L” shape screw driver comprising an Allen head and a Philips head and the blade in rotational attachment to the body.

Item 2. The tool of item 1 wherein the sockets or other work pieces are of different sizes from each other.

Item 3. The tool of item 1 wherein a first socket is a {fraction (9/16)} inch socket, a second socket is a 1/2 inch socket, and a third socket is a 3/8 inch socket.

Item 4. The tool of item 1 wherein the “L” shaped screw driver comprises a metal file portion (620).

Item 5. The tool of item 1 wherein the body contains a T switch and an internal ratchet mechanism in attachment to the third arm.

What is claimed is:

1. A skate tool (100), of a “T” shape, the tool comprising
  - a. a body (500), the body having a front side, a back side, a lower vertical component, a lower end cap, an upper cover, the upper cover having a first end and a second end;
  - b. a first arm (200), of a longitudinal shape, the first arm horizontally attached to the body, the first arm having

6

a distal end and a proximal end, the distal end attached to a first socket (230), the proximal end is comported to fit into the first end of the upper cover;

- c. a second arm (300), of a longitudinal shape, the second arm horizontally attached to the body, the second arm having a distal end and a proximal end, the distal end attached to a second socket (330), the proximal end is comported to fit into the second end of the upper cover;
  - d. a re-threading tool (540), the re-threading tool attached to the front side of the body above the lower vertical component of the body;
  - e. the lower vertical component comprising a ratchet selector switch, the ratchet selector switch configured below the re-threading tool controls rotational force of a third arm (400), of a longitudinal shape, the third arm vertically attached to the body, the third arm having a distal end and a proximal end, the distal end attached to an end socket (430), the proximal end attached to the lower vertical component; and
  - f. wherein the back side of the body defines an upper void (523) and a lower void (580), the upper void comorting to a screwdriver, of a “L” shape (600), the screw driver contained within the upper void, the lower void configured below the upper void, the lower void comorting to a blade (700), of an externally flat longitudinal shape, the blade defining a pin void (710), the pin void configured to accept a pin, the pin configured to be retained within the body allowing the blade to have a rotational attachment with the body.
2. The skate tool of claim 1 wherein the screw driver comprises:
    - a. a longer longitudinal member (607), a shorter longitudinal member (605), a metal file section (620);
    - b. the longer longitudinal member having a distal end and a proximal end, the distal end attached to a Philips screw head (610),
    - c. shorter longitudinal member having a distal end and a proximal end, the distal end attached to an Allen head (630),
    - d. the longer longitudinal member attached at a right or near right angle to the proximal end of the shorter longitudinal member; and
    - e. the metal file section is disposed upon the longer longitudinal member.
