ABSTRACT

A bicycle hub assembly comprises a hub axle, a hub shell, a sprocket support body, a first ratchet member, a second ratchet member, and a sliding member. The hub shell includes at least one first tooth. The sprocket support body includes a first helical spline. The first ratchet member comprises at least one first ratchet tooth and a second helical spline engaged with the first helical spline. The second ratchet member comprises at least one second ratchet tooth and at least one second tooth. The at least one second ratchet tooth is engageable with the at least one first ratchet tooth. The at least one second tooth is engaged with the at least one first tooth. The sliding member is provided between the sprocket support body and the second ratchet member in an axial direction parallel to a rotational axis. The sliding member includes a non-metallic material.

BICYCLE HUB ASSEMBLY**CROSS-REFERENCE TO RELATED APPLICATIONS**

The present application is a divisional application of the U.S. patent application Ser. No. 14/873,141 filed Oct. 1, 2015. The contents of this application are incorporated herein by reference in their entirety.

BACKGROUND OF THE INVENTION**Field of the Invention**

The present invention relates to a bicycle hub assembly.

Discussion of the Background

Bicycling is becoming an increasingly more popular form of recreation as well as a means of transportation. Moreover, bicycling has become a very popular competitive sport for both amateurs and professionals. Whether the bicycle is used for recreation, transportation or competition, the bicycle industry is constantly improving the various components of the bicycle. One bicycle component that has been extensively redesigned is a bicycle hub assembly.

SUMMARY OF THE INVENTION

In accordance with a first aspect of the present invention, a bicycle hub assembly comprises a hub axle, a hub shell, a sprocket support body, a first ratchet member, a second ratchet member, and a sliding member. The hub axle defines a rotational axis. The hub shell is rotatably mounted on the hub axle to rotate about the rotational axis. The hub shell includes at least one first tooth. The sprocket support body is rotatably mounted on the hub axle to rotate about the rotational axis. The sprocket support body includes a first helical spline. The first ratchet member comprises at least one first ratchet tooth and a second helical spline engaged with the first helical spline. The second ratchet member comprises at least one second ratchet tooth and at least one second tooth. The at least one second ratchet tooth is engageable with the at least one first ratchet tooth. The at least one second tooth is engaged with the at least one first tooth. The sliding member is provided between the sprocket support body and the second ratchet member in an axial direction parallel to the rotational axis. The sliding member includes a non-metallic material.

With the bicycle hub assembly according to the first aspect, it is possible to reduce or prevent friction sound caused by direct contact between the sprocket support body and the second ratchet member.

In accordance with a second aspect of the present invention, the bicycle hub assembly according to the first aspect is configured so that the sprocket support body includes a first axial surface facing in the axial direction. The second ratchet member includes a second axial surface facing in the axial direction. The sliding member is provided between the first axial surface and the second axial surface in the axial direction.

With the bicycle hub assembly according to the second aspect, it is possible to reduce or prevent friction sound caused by direct contact between the first axial surface and the second axial surface.

In accordance with a third aspect of the present invention, the bicycle hub assembly according to the first or second aspect is configured so that the sliding member has an annular shape.

2

With the bicycle hub assembly according to the third aspect, it is possible to effectively reduce or prevent friction sound caused by direct contact between the sprocket support body and the second ratchet member with securing strength of the sliding member.

In accordance with a fourth aspect of the present invention, the bicycle hub assembly according to any one of the first or third aspects is configured so that the second ratchet member is provided between the first ratchet member and the sliding member in the axial direction.

With the bicycle hub assembly according to the fourth aspect, the sliding member can receive an axial force applied from the first ratchet member to the second ratchet member in the axial direction.

In accordance with a fifth aspect of the present invention, the bicycle hub assembly according to any one of the first to fourth aspects is configured so that the non-metallic material includes a resin material.

With the bicycle hub assembly according to the fifth aspect, it is possible to reduce or prevent friction sound caused by direct contact between the sprocket support body and the second ratchet member with suppressing an increase in weight of the bicycle hub assembly.

In accordance with a sixth aspect of the present invention, a bicycle hub assembly comprises a hub axle, a hub shell, a sprocket support body, a first ratchet member, a second ratchet member, a biasing member, and an additional biasing member. The hub axle defines a rotational axis. The hub shell is rotatably mounted on the hub axle to rotate about the rotational axis. The hub shell includes at least one first tooth. The sprocket support body is rotatably mounted on the hub axle to rotate about the rotational axis. The sprocket support body includes a first helical spline. The first ratchet member comprises at least one first ratchet tooth and a second helical spline engaged with the first helical spline. The second ratchet member comprises at least one second ratchet tooth and at least one second tooth. The at least one second ratchet tooth is engageable with the at least one first ratchet tooth. The at least one second tooth is engaged with the at least one first tooth. The biasing member is provided between the hub shell and the first ratchet member in an axial direction parallel to the rotational axis to bias the first ratchet member toward the second ratchet member. The additional biasing member is provided between the hub shell and the second ratchet member in the axial direction to bias the second ratchet member toward the sprocket support body.

With the bicycle hub assembly according to the sixth aspect, it is possible to stabilize an orientation of the second ratchet member relative to the hub shell by the additional biasing member. This can reduce or prevent friction sound caused by direct contact between the hub shell and the second ratchet member.

In accordance with a seventh aspect of the present invention, the bicycle hub assembly according to the sixth aspect is configured so that the additional biasing member is provided radially outwardly of the biasing member.

With the bicycle hub assembly according to the seventh aspect, it is possible to effectively stabilize the orientation of the second ratchet member relative to the hub shell by the additional biasing member.

In accordance with an eighth aspect of the present invention, the bicycle hub assembly according to the sixth or seventh aspect is configured so that the additional biasing member is provided radially outwardly of the at least one second ratchet tooth.

With the bicycle hub assembly according to the eighth aspect, it is possible to utilize a space provided radially

3

outwardly of the at least one sound ratchet tooth as a space in which the additional biasing member.

In accordance with a ninth aspect of the present invention, the bicycle hub assembly according to any one of the sixth to eighth aspects is configured so that the second ratchet member includes a cylindrical element extending in the axial direction. The at least one second tooth extends radially outwardly from the cylindrical element. The additional biasing member is provided between the hub shell and the cylindrical element in the axial direction.

With the bicycle hub assembly according to the ninth aspect, it is possible to effectively stabilize the orientation of the second ratchet member relative to the hub shell by the additional biasing member.

In accordance with a tenth aspect of the present invention, the bicycle hub assembly according to any one of the sixth to ninth aspects further comprises a supporting member provided between the second ratchet member and the additional biasing member in the axial direction.

With the bicycle hub assembly according to the tenth aspect, it is possible to stabilize an orientation of the additional biasing member relative to the hub shell by the supporting member.

In accordance with an eleventh aspect of the present invention, the bicycle hub assembly according to the tenth aspect is configured so that the supporting member includes an annular base and a radially supporting portion. The annular base is provided between the second ratchet member and the additional biasing member in the axial direction. The radially supporting portion extends from the annular base in the axial direction. The additional biasing member is provided radially outwardly of the radially supporting portion.

With the bicycle hub assembly according to the eleventh aspect, it is possible to further stabilize an orientation of the additional biasing member relative to the hub shell by the supporting member.

In accordance with a twelfth aspect of the present invention, the bicycle hub assembly according to the tenth or eleventh aspect is configured so that the supporting member includes a non-metallic material.

With the bicycle hub assembly according to the twelfth aspect, it is possible to effectively stabilize the orientation of the additional biasing member relative to the hub shell by the supporting member with suppressing an increase in weight of the bicycle hub assembly.

In accordance with a thirteenth aspect of the present invention, a bicycle hub assembly comprises a hub axle, a hub shell, a sprocket support body, a first ratchet member, a second ratchet member, a biasing member, and a receiving member. The hub axle defines a rotational axis. The hub shell is rotatably mounted on the hub axle to rotate about the rotational axis. The hub shell includes at least one first tooth. The sprocket support body is rotatably mounted on the hub axle to rotate about the rotational axis. The sprocket support body includes a first helical spline. The first ratchet member comprises at least one first ratchet tooth and a second helical spline engaged with the first helical spline. The second ratchet member comprises at least one second ratchet tooth and at least one second tooth. The at least one second ratchet tooth is engageable with the at least one first ratchet tooth. The at least one second tooth is engaged with the at least one first tooth. The biasing member is provided between the hub shell and the first ratchet member in an axial direction parallel to the rotational axis to bias the first ratchet member toward the second ratchet member. The receiving member is provided between the first ratchet member and the biasing member in the axial direction.

4

With the bicycle hub assembly according to the thirteenth aspect, it is possible to stabilize an orientation of the biasing member relative to the hub shell by the receiving member. This can stabilize a motion of the first ratchet member, preventing uneven wear of at least one of the first ratchet member and the second ratchet member.

In accordance with a fourteenth aspect of the present invention, the bicycle hub assembly according to the thirteenth aspect is configured so that the first ratchet member includes a first receiving surface facing in the axial direction. The receiving member is provided between the first receiving surface and the biasing member in the axial direction.

With the bicycle hub assembly according to the fourteenth aspect, it is possible to stabilize an orientation of the receiving member relative to the first ratchet member. This can stabilize the orientation of the biasing member relative to the hub shell. Accordingly, it is possible to effectively prevent uneven wear of at least one of the first ratchet member and the second ratchet member.

In accordance with a fifteenth aspect of the present invention, the bicycle hub assembly according to the thirteenth or fourteenth aspect is configured so that the first ratchet member includes a cylindrical part extending from the first receiving surface in the axial direction. The receiving member is provided radially outwardly of the cylindrical part.

With the bicycle hub assembly according to the fifteenth aspect, it is possible to further stabilize the orientation of the receiving member relative to the first ratchet member. This can further stabilize the orientation of the biasing member relative to the hub shell. Accordingly, it is possible to effectively prevent uneven wear of at least one of the first ratchet member and the second ratchet member.

In accordance with a sixteenth aspect of the present invention, the bicycle hub assembly according to the fifteenth aspect is configured so that the receiving member includes an axially receiving part and a radially receiving part. The axially receiving part is provided between the first receiving surface and the biasing member in the axial direction. The radially receiving part extends from the axially receiving part in the axial direction. The radially receiving part is provided between the cylindrical part and the biasing member in a radial direction perpendicular to the rotational axis.

With the bicycle hub assembly according to the sixteenth aspect, it is possible to further stabilize the orientation of the biasing member relative to the hub shell. Accordingly, it is possible to more effectively prevent uneven wear of at least one of the first ratchet member and the second ratchet member.

In accordance with a seventeenth aspect of the present invention, the bicycle hub assembly according to any one of the thirteenth to sixteenth aspects is configured so that the receiving member includes a non-metallic material.

With the bicycle hub assembly according to the seventeenth aspect, it is possible to reduce or prevent wear of at least one of the biasing member and the first ratchet member with suppressing an increase in weight of the bicycle hub assembly.

BRIEF DESCRIPTION OF THE DRAWINGS

A more complete appreciation of the invention and many of the attendant advantages thereof will be readily obtained as the same becomes better understood by reference to the following detailed description when considered in connection with the accompanying drawings.

5

FIG. 1 is a perspective view of a bicycle hub assembly in accordance with a first embodiment.

FIG. 2 is a cross-sectional view of the bicycle hub assembly taken along line II-II of FIG. 1.

FIG. 3 is an exploded perspective view of a part of the bicycle hub assembly illustrated in FIG. 1.

FIG. 4 is an exploded perspective view of a part of the bicycle hub assembly illustrated in FIG. 1.

FIG. 5 is an exploded perspective view of a part of the bicycle hub assembly illustrated in FIG. 1.

FIG. 6 is an exploded perspective view of a part of the bicycle hub assembly illustrated in FIG. 1.

FIG. 7 is a partial cross-sectional view of the bicycle hub assembly illustrated in FIG. 1.

FIG. 8 is a cross-sectional view of the bicycle hub assembly taken along line VIII-VIII of FIG. 2.

FIG. 9 is a perspective view of a spacer of the bicycle hub assembly illustrated in FIG. 1.

FIG. 10 is a perspective view of a spacer of the bicycle hub assembly illustrated in FIG. 1.

FIG. 11 is a partial cross-sectional view of the bicycle hub assembly taken along line VIII-VIII of FIG. 2.

FIG. 12 is a perspective view of a supporting member of the bicycle hub assembly illustrated in FIG. 1.

FIG. 13 is a perspective view of a supporting member of the bicycle hub assembly illustrated in FIG. 1.

FIG. 14 is a perspective view of a sliding member of the bicycle hub assembly illustrated in FIG. 1.

FIG. 15 is a perspective view of a receiving member of the bicycle hub assembly illustrated in FIG. 1.

FIG. 16 is a perspective view of the receiving member of the bicycle hub assembly illustrated in FIG. 1.

FIG. 17 is a schematic diagram showing an action of a first ratchet member and a sprocket support body of the bicycle hub assembly illustrated in FIG. 1 (pedaling).

FIG. 18 is a schematic diagram showing an action of the first ratchet member and the sprocket support body of the bicycle hub assembly illustrated in FIG. 1 (coasting).

DESCRIPTION OF THE EMBODIMENTS

The embodiments will now be described with reference to the accompanying drawings, wherein like reference numerals designate corresponding or identical elements throughout the various drawings.

Referring initially to FIG. 1, a bicycle hub assembly 10 in accordance with an embodiment is illustrated. While the bicycle hub assembly 10 is a rear hub assembly in this embodiment, structures of the bicycle hub assembly 10 can be applied to a front hub assembly if needed and/or desired.

In the present application, the following directional terms “front”, “rear”, “forward”, “rearward”, “left”, “right”, “transverse”, “upward” and “downward” as well as any other similar directional terms refer to those directions which are determined on the basis of a user (e.g., a rider) who sits on a saddle (not shown) of a bicycle (not shown) with facing a handlebar. Accordingly, these terms, as utilized to describe the bicycle hub assembly 10, should be interpreted relative to the bicycle equipped with the bicycle hub assembly 10 as used in an upright riding position on a horizontal surface.

As seen in FIG. 1, the bicycle hub assembly 10 comprises a hub axle 12, a hub shell 14, and a sprocket support body 16. The hub axle 12 defines a rotational axis A1. For example, the hub axle 12 is secured to a bicycle frame (not shown) via a wheel securing assembly (not shown). The hub shell 14 is rotatably mounted on the hub axle 12 to rotate

6

about the rotational axis A1. A rim (not shown) is coupled to the hub shell 14 via spokes (not shown). The sprocket support body 16 is rotatably mounted on the hub axle 12 to rotate about the rotational axis A1. The sprocket support body 16 is rotatable relative to the hub shell 14 about the rotational axis A1.

As seen in FIG. 2, the sprocket support body 16 is mounted to the hub axle 12 support a sprocket assembly 2 including sprockets S1 to S11. The sprocket support body 16 is mounted to the hub axle 12 to receive a rotational force from the sprocket assembly 2 during pedaling. The bicycle hub assembly 10 comprises a first bearing 18 and a second bearing 20. The first bearing 18 and the second bearing 20 are provided between the hub axle 12 and the hub shell 14 to rotatably support the hub shell 14 relative to the hub axle 12 about the rotational axis A1.

The bicycle hub assembly 10 comprises a third bearing 22 and a fourth bearing 24. The third bearing 22 and the fourth bearing 24 are provided between the hub axle 12 and the sprocket support body 16 to rotatably support the sprocket support body 16 relative to the hub axle 12 about the rotational axis A1. The third bearing 22 and the fourth bearing 24 are provided between the hub axle 12 and the sprocket support body 16 to rotatably support the sprocket support body 16 relative to the hub axle 12 about the rotational axis A1.

As seen in FIG. 3, the bicycle hub assembly 10 comprises a first ratchet member 26 and a second ratchet member 28. The first ratchet member 26 is mounted to the sprocket support body 16 to rotate together with the sprocket support body 16 relative to the hub shell 14 about the rotational axis A1. The first ratchet member 26 is movable relative to the sprocket support body 16 in an axial direction D1 parallel to the rotational axis A1. In this embodiment, the axial direction D1 includes a first axial direction D11 and a second axial direction D12 opposite to the first axial direction D11. The second ratchet member 28 is mounted to the hub shell 14 to rotate together with the hub shell 14 relative to the sprocket support body 16 about the rotational axis A1. The second ratchet member 28 is movable relative to the hub shell 14 in the axial direction D1. The sprocket support body 16, the first ratchet member 26, and the second ratchet member 28 provide a bicycle freewheel 30.

The bicycle freewheel 30 prevents the sprocket support body 16 from rotating relative to the hub shell 14 in a driving rotational direction D21 so that a pedaling force is transmitted from the sprocket support body 16 to the hub shell 14 during pedaling. The bicycle freewheel 30 allows the hub shell 14 to rotate relative to the sprocket support body 16 in the driving rotational direction D21 so that a rotational force is not transmitted from the hub shell 14 to the sprocket support body 16 during coasting (also called freewheeling). The driving rotational direction D21 is a direction in which the sprocket support body 16 rotates relative to a bicycle frame (not shown) during pedaling. A circumferential direction D3 of the bicycle hub assembly 10 includes the driving rotational direction D21 and an opposite rotational direction D22 opposite to the driving rotational direction D21. Coasting or freewheeling occurs when the sprocket support body 16 stops rotating relative to the bicycle frame (not shown) in an opposite rotational direction D22 while the hub shell 14 rotates relative to the bicycle frame (not shown) in the driving rotational direction D21.

As seen in FIG. 3, the hub shell 14 includes a freewheel housing 32 having an annular shape. As seen in FIG. 2, the freewheel housing 32 extends in the axial direction D1. The

7

first ratchet member 26 and the second ratchet member 28 are provided in the freewheel housing 32.

As seen in FIG. 4, the hub shell 14 includes an inner peripheral surface 33 and at least one first tooth 34. The at least one first tooth 34 is provided on the inner peripheral surface 33. In this embodiment, the freewheel housing 32 includes the inner peripheral surface 33. The hub shell 14 includes a plurality of first teeth 34. The first teeth 34 are provided on the inner peripheral surface 33 and extend radially inwardly from the inner peripheral surface 33. The first teeth 34 are arranged in a circumferential direction D3 to define recesses 35 between adjacent two teeth of the first teeth 34. The circumferential direction D3 is defined about the rotational axis A1 and includes the driving rotational direction D21 and the opposite rotational direction D22.

The second ratchet member 28 comprises at least one second tooth 36. The at least one second tooth 36 is engaged with the at least one first tooth 34. In this embodiment, the second ratchet member 28 comprises a plurality of second teeth 36. The second teeth 36 are engaged with the first teeth 34. The second teeth 36 are arranged in the circumferential direction D3. The second teeth 36 are respectively provided in the recesses 35.

As seen in FIGS. 5 and 6, the sprocket support body 16 includes a first helical spline 38. The first helical spline 38 includes first spline teeth 40 and first spline grooves 42 defined between adjacent two teeth of the first spline teeth 40. The first ratchet member 26 comprises at least one first ratchet tooth 44 and a second helical spline 46 engaged with the first helical spline 38. In this embodiment, the first ratchet member 26 comprises a plurality of first ratchet teeth 44. The first ratchet teeth 44 are arranged in the circumferential direction D3. The second helical spline 46 includes second spline teeth 48 and second spline grooves 50 defined between adjacent two teeth of the second spline teeth 48. The second spline teeth 48 are respectively provided in the first spline grooves 42. The first spline teeth 40 are respectively provided in the second spline grooves 50.

In this embodiment, the first ratchet member 26 includes a first ratchet body 52. The first ratchet body 52 has an annular shape. The first ratchet teeth 44 are provided on an axial side of the first ratchet body 52. The first ratchet teeth 44 radially extend relative to the rotational axis A1. The first ratchet teeth 44 provide a serration on the axial side of the first ratchet body 52. The second helical spline 46 is provided on an inner periphery of the first ratchet body 52. The second spline teeth 48 are provided on the inner periphery of the first ratchet body 52.

As seen in FIG. 6, the sprocket support body 16 includes guiding portions 54. Only one of the guiding portions 54 is illustrated in FIG. 6. The guiding portions 54 are configured to guide the first ratchet member 26 toward the hub shell 14 during coasting or freewheeling. The guiding portions 54 are configured to move the first ratchet member 26 away from the second ratchet member 28 in the axial direction D1. The guiding portion 54 extends from one of the first ratchet teeth 44 in at least the circumferential direction D3. While the guiding portion 54 is integrally provided with the first spline teeth 40 as a one-piece unitary member in this embodiment, the guiding portion 54 can be a separate member from the first spline teeth 40.

The second ratchet member 28 comprises at least one second ratchet tooth 56. The at least one second ratchet tooth 56 is engageable with the at least one first ratchet tooth 44. In this embodiment, the second ratchet member 28 comprises a plurality of second ratchet teeth 56. The second ratchet teeth 56 are arranged in the circumferential direction

8

D3. The second ratchet teeth 56 are engageable with the first ratchet teeth 44. The first ratchet member 26 and the second ratchet member 28 rotate together in a state where the second ratchet teeth 56 are engaged with the first ratchet teeth 44.

In this embodiment, the second ratchet member 28 includes a second ratchet body 58. The second ratchet body 58 has an annular shape. The second ratchet member 28 includes an outer peripheral surface 59. In this embodiment, the second ratchet body 58 includes the outer peripheral surface 59. The at least one second tooth 36 is provided on the outer peripheral surface 59 of the second ratchet member 28. In this embodiment, the second teeth 36 are provided on the outer peripheral surface 59 of the second ratchet member 28.

The second ratchet teeth 56 are provided on an axial side of the second ratchet body 58. The second ratchet teeth 56 radially extend relative to the rotational axis A1. The second ratchet teeth 56 provide a serration on the axial side of the second ratchet body 58. The second teeth 36 extend radially outwardly from the second ratchet body 58.

As seen in FIG. 3, the bicycle hub assembly 10 comprises a biasing member 60. The biasing member 60 is provided between the hub shell 14 and the first ratchet member 26 in the axial direction D1 parallel to the rotational axis A1 to bias the first ratchet member 26 toward the second ratchet member 28. In this embodiment, for example, the biasing member 60 is a compression spring.

As seen in FIG. 7, the biasing member 60 is compressed between the hub shell 14 and the first ratchet member 26 in the axial direction D1. The biasing member 60 biases the first ratchet member 26 toward the second ratchet member 28 to maintain an engagement state where the first ratchet member 26 and the second ratchet member 28 are engaged with each other via the first ratchet teeth 44 and the second ratchet teeth 56.

Preferably, the biasing member 60 is mounted to the hub shell 14 to rotate together with the hub shell 14 about the rotational axis A1 (FIG. 3). The biasing member 60 includes a coiled body 60a and a connecting end 60b. The hub shell 14 includes a connecting hole 14a. The connecting end 60b is provided in the connecting hole 14a so that the biasing member 60 rotates together with the hub shell 14 about the rotational axis A1.

As seen in FIG. 3, the bicycle hub assembly 10 comprises a spacer 62, a supporting member 64, a sliding member 66, an additional biasing member 68, and a receiving member 70. However, it is possible to omit at most four of the spacer 62, the supporting member 64, the sliding member 66, the additional biasing member 68, and the receiving member 70 from the bicycle hub assembly 10.

As seen in FIGS. 7 and 8, the spacer 62 is at least partly provided between the at least one first tooth 34 and the at least one second tooth 36 in the circumferential direction D3 defined about the rotational axis A1. In this embodiment, the spacer 62 is partly provided between the first teeth 34 and the second teeth 36 in the circumferential direction D3. However, the spacer 62 can be entirely provided between the first teeth 34 and the second teeth 36 in the circumferential direction D3.

As seen in FIGS. 8 to 10, the spacer 62 includes at least one intermediate portion 72 provided between the at least one first tooth 34 and the at least one second tooth 36. The at least one intermediate portion 72 is provided between the at least one first tooth 34 and the at least one second tooth 36 in the circumferential direction D3. In this embodiment, the spacer 62 includes a plurality of intermediate portions 72

9

respectively provided between the first teeth **34** and the second teeth **36** in the circumferential direction **D3**. While the spacer **62** includes the intermediate portions **72** in this embodiment, the spacer **62** can include one intermediate portion **72**.

As seen in FIG. **11**, the first tooth **34** includes a first surface **34a** and a second tooth **34b**. The first surface **34a** faces in the driving rotational direction **D21**. The second surface **34b** faces in the opposite rotational direction **D22**. The second tooth **36** includes a third surface **36a** and a fourth surface **36b**. The third surface **36a** faces in the driving rotational direction **D21**. The fourth surface **36b** faces in the opposite rotational direction **D22**. The intermediate portion **72** is provided between the second surface **34b** and the third surface **36a** in the circumferential direction **D3**. However, the intermediate portion **72** can be provided between the first surface **34a** and the fourth surface **36b** in the circumferential direction **D3**.

As seen in FIGS. **9** and **10**, the spacer **62** includes an annular portion **74**. The at least one intermediate portion **72** extends from the annular portion **74** in the axial direction **D1** parallel to the rotational axis **A1**. The intermediate portions **72** extend from the annular portion **74** in the axial direction **D1**. While the spacer **62** includes the annular portion **74** in this embodiment, the annular portion **74** can be omitted from the spacer **62**.

The spacer **62** including a non-metallic material. In this embodiment, the non-metallic material includes a resin material. Examples of the resin material include synthetic resin. The non-metallic material can include a material other than the resin material instead of or in addition to the resin material. While the intermediate portions **72** and the annular portion **74** are integrally provided with each other as a one-piece unitary member in this embodiment, at least one of the intermediate portions **72** can be a separate portion from the annular portion **74**.

As seen in FIGS. **7** and **8**, the outer peripheral surface **59** faces the inner peripheral surface **33** of the hub shell **14** in a radial direction perpendicular to the rotational axis **A1** (FIG. **8**). The at least one intermediate portion **72** is provided between the inner peripheral surface **33** of the hub shell **14** and the outer peripheral surface **59** of the second ratchet member **28** in the radial direction. In this embodiment, the intermediate portions **72** are provided between the inner peripheral surface **33** of the hub shell **14** and the outer peripheral surface **59** of the second ratchet member **28** in the radial direction.

As seen in FIG. **7**, the supporting member **64** is provided between the hub shell **14** and the spacer **62** in the axial direction **D1** parallel to the rotational axis **A1**. The supporting member **64** is provided between the hub shell **14** and the second ratchet member **28** in the axial direction **D1**. The hub shell **14** includes a hub axial surface **76** facing in the axial direction **D1**. The supporting member **64** is provided between the hub axial surface **76** and the second ratchet member **28** in the axial direction **D1**.

As seen in FIGS. **12** and **13**, the supporting member **64** includes an annular base **78** and an axially supporting portion **80**. The axially supporting portion **80** extends radially outwardly from the annular base **78**. As seen in FIG. **7**, the annular base **78** is attached to the second ratchet member **28**. The axially supporting portion **80** faces the at least one intermediate portion **72** in the axial direction **D1**. In this embodiment, as seen in FIGS. **12** and **13**, the axially supporting portion **80** includes protruding parts **82**. The protruding parts **82** are arranged in the circumferential direction **D3** and extend radially outwardly from the annular

10

base **78**. As seen in FIG. **7**, the protruding parts **82** respectively face the intermediate portions **72** in the axial direction **D1**. While the axially supporting portion **80** includes the protruding parts **82** in this embodiment, the axially supporting portion **80** can have other shapes such as an annular shape. While the axially supporting portion **80** includes the protruding parts **82** in this embodiment, the axially supporting portion **80** can include one protruding part **82**.

As seen in FIGS. **12** and **13**, the supporting member **64** includes a radially supporting portion **84**. The radially supporting portion **84** extends from the annular base **78** in the axial direction **D1**. As seen in FIG. **7**, the radially supporting portion **84** is provided radially inwardly of the additional biasing member **68**. While the radially supporting portion **84** has an annular shape in this embodiment, the shape of the radially supporting portion **84** is not limited to this embodiment.

As seen in FIGS. **12** and **13**, the supporting member **64** includes an attachment portion **85**. The attachment portion **85** is provided on an opposite side of the radially supporting portion **84** relative to the annular base **78**. The attachment portion **85** has a substantially annular shape and extends from the annular base **78** in the axial direction **D1**.

As seen in FIG. **7**, the second ratchet member **28** includes an attachment groove **28a** having an annular shape. The attachment portion **85** is engaged with the attachment groove **28a**. The supporting member **64** is secured to the second ratchet member **28** by the attachment portion **85** and the attachment groove **28a**.

The supporting member **64** includes a non-metallic material. In this embodiment, the non-metallic material includes a resin material. The non-metallic material can include a material other than the resin material instead of or in addition to the resin material. The annular base **78**, the axially supporting portion **80**, the radially supporting portion **84**, and the attachment portion **85** are integrally provided with each other as a one-piece unitary member. However, at least one of the axially supporting portion **80**, the radially supporting portion **84**, and the attachment portion **85** can be a separate portion from the annular base **78**.

As seen in FIG. **7**, the sliding member **66** is provided between the sprocket support body **16** and the second ratchet member **28** in the axial direction **D1** parallel to the rotational axis **A1**. The sprocket support body **16** includes a first axial surface **86** facing in the axial direction **D1**. The second ratchet member **28** includes a second axial surface **88** facing in the axial direction **D1**. The sliding member **66** is provided between the first axial surface **86** and the second axial surface **88** in the axial direction **D1**. The second ratchet member **28** is provided between the first ratchet member **26** and the sliding member **66** in the axial direction **D1**.

In this embodiment, as seen in FIG. **14**, the sliding member **66** has an annular shape. However, the shape of the sliding member **66** is not limited to the annular shape. The sliding member **66** includes a non-metallic material. In this embodiment, the non-metallic material includes a resin material. The non-metallic material can include a material other than the resin material instead of or in addition to the resin material.

As seen in FIG. **7**, the additional biasing member **68** is provided between the hub shell **14** and the second ratchet member **28** in the axial direction **D1** to bias the second ratchet member **28** toward the second ratchet member **28**. The additional biasing member **68** is provided radially outwardly of the biasing member **60**. The additional biasing member **68** is provided radially outwardly of the at least one

11

second ratchet tooth 56. In this embodiment, the additional biasing member 68 is provided radially outwardly of the second ratchet teeth 56.

As seen in FIGS. 6 and 7, the second ratchet member 28 includes a cylindrical element 90 extending in the axial direction D1. The at least one second tooth 36 extends radially outwardly from the cylindrical element 90. In this embodiment, the second ratchet body 58 includes the cylindrical element 90. The second teeth 36 extend radially outwardly from the cylindrical element 90.

As seen in FIG. 7, the additional biasing member 68 is provided between the hub shell 14 and the cylindrical element 90 in the axial direction D1. The supporting member 64 is provided between the second ratchet member 28 and the additional biasing member 68 in the axial direction D1. The annular base 78 is provided between the second ratchet member 28 and the additional biasing member 68 in the axial direction D1. The additional biasing member 68 is provided radially outwardly of the radially supporting portion 84.

The receiving member 70 is provided between the first ratchet member 26 and the biasing member 60 in the axial direction D1. The first ratchet member 26 includes a first receiving surface 92 facing in the axial direction D1. The receiving member 70 is provided between the first receiving surface 92 and the biasing member 60 in the axial direction D1.

As seen in FIGS. 6 and 7, the first ratchet member 26 includes a cylindrical part 94 extending from the first receiving surface 92 in the axial direction D1. The receiving member 70 is provided radially outwardly of the cylindrical part 94.

As seen in FIGS. 15 and 16, the receiving member 70 includes an axially receiving part 96 and a radially receiving part 98. In this embodiment, each of the axially receiving part 96 and the radially receiving part 98 has an annular shape. As seen in FIG. 7, the axially receiving part 96 is provided between the first receiving surface 92 and the biasing member 60 in the axial direction D1. The radially receiving part 98 extends from the axially receiving part 96 in the axial direction D1. The radially receiving part 98 is provided between the cylindrical part 94 and the biasing member 60 in the radial direction perpendicular to the rotational axis A1.

The receiving member 70 includes a non-metallic material. In this embodiment, the non-metallic material includes a resin material. The non-metallic material can include a material other than the resin material instead of or in addition to the resin material. The axially receiving part 96 and the radially receiving part 98 are integrally provided with each other as a one-piece unitary member. However, the axially receiving part 96 can be a separate member from the radially receiving part 98.

The action of the bicycle hub assembly 10 will be described in detail below referring to FIGS. 7, 17, and 18.

As seen in FIG. 7, the axial direction D1 includes a first axial direction D11 and a second axial direction D12 opposite to the first axial direction D11. A biasing force F1 is applied from the biasing member 60 to the receiving member 70 in the first axial direction D11. The biasing force F1 of the biasing member 60 biases the receiving member 70, the first ratchet member 26, the second ratchet member 28, and the sliding member 66 toward the sprocket support body 16 in the first axial direction D11. This brings the first ratchet teeth 44 into engagement with the second ratchet teeth 56.

Furthermore, as seen in FIG. 17, when a pedaling torque T1 is input to the sprocket support body 16 in the driving

12

rotational direction D21, the second spline teeth 48 are guided by the first spline teeth 40 relative to the sprocket support body 16 in the first axial direction D11. This strongly brings the first ratchet teeth 44 into engagement with the second ratchet teeth 56. In this state, the pedaling torque T1 is transmitted from the sprocket support body 16 to the hub shell 14 (FIG. 7) via the first ratchet member 26 and the second ratchet member 28 (FIG. 7).

As seen in FIG. 18, a coasting torque T2 is applied to the hub shell 14 in the driving rotational direction D21 during coasting. The coasting torque T2 is transmitted from the hub shell 14 (FIG. 7) to the first ratchet member 26 via the second ratchet member 28 (FIG. 7). At this time, the second spline teeth 48 are guided by the first spline teeth 40 relative to the support sprocket body 16 in the second axial direction D12. This moves the first ratchet member 26 relative to the sprocket support body 16 in the second axial direction D12 against the biasing force F1. Thus, the first ratchet member 26 is moved away from the second ratchet member 28 in the second axial direction D12, causing the engagement between the first ratchet teeth 44 and the second ratchet teeth 56 to be weaker. This allows the second ratchet member 28 to rotate relative to the first ratchet member 26 in the driving rotational direction D21, preventing the coasting torque T2 from being transmitted from the hub shell 14 to the sprocket support body 16 via the first ratchet member 26 and the second ratchet member 28. At this time, the first ratchet teeth 44 slide with the second ratchet teeth 56 in the circumferential direction D3.

The bicycle hub assembly 10 has the following features.

(1) The spacer 62 is at least partly provided between the at least one first tooth 34 and the at least one second tooth 36 in a circumferential direction D3 defined about the rotational axis A1. The spacer 62 includes the non-metallic material. Accordingly, it is possible to reduce or prevent friction sound caused by direct contact between the at least one first tooth 34 and the at least one second tooth 36.

(2) The at least one intermediate portion 72 is provided between the at least one first tooth 34 and the at least one second tooth 36. Accordingly, it is possible to effectively reduce or prevent the friction sound caused by direct contact between the at least one first tooth 34 and the at least one second tooth 36.

(3) The at least one intermediate portion 72 extends from the annular portion 74 in the axial direction D1 parallel to the rotational axis A1. Accordingly, it is possible to easily detach or attach the at least one intermediate portion 72 from or to the at least one first tooth 34 and the at least one second tooth 36.

(4) Since the non-metallic material includes a resin material, it is possible to effectively reduce or prevent the friction sound caused by direct contact between the at least one first tooth 34 and the at least one second tooth 36 with suppressing an increase in weight of the bicycle hub assembly 10.

(5) The at least one first tooth 34 is provided on the inner peripheral surface 33. The at least one second tooth 36 is provided on the outer peripheral surface 59 of the second ratchet member 28. Accordingly, it is possible to make the bicycle hub assembly 10 compact.

(6) The at least one intermediate portion 72 is provided between the inner peripheral surface 33 of the hub shell 14 and the outer peripheral surface 59 of the second ratchet member 28 in the radial direction. Accordingly, it is possible to effectively reduce or prevent the friction sound caused by direct contact between the at least one first tooth 34 and the at least one second tooth 36 with making the bicycle hub assembly 10 compact.

13

(7) The supporting member **64** is provided between the hub shell **14** and the spacer **62** in the axial direction **D1** parallel to the rotational axis **A1**. Accordingly, it is possible to prevent the spacer **62** from being removed from the hub shell **14** even when the spacer **62** is broken.

(8) The supporting member **64** is provided between the hub shell **14** and the second ratchet member **28** in the axial direction **D1**. Accordingly, it is possible to effectively prevent the spacer **62** from being removed from the hub shell **14** even when the spacer **62** is broken.

(9) The supporting member **64** is provided between the hub axial surface **76** and the second ratchet member **28** in the axial direction **D1**. Accordingly, it is possible to effectively prevent the spacer **62** from being removed from the hub shell **14** even when the spacer **62** is broken.

(10) The supporting member **64** includes the annular base **78** and the supporting portion **80**. Accordingly, it is possible to effectively prevent the at least one intermediate portion **72** of the spacer **62** from being removed from the hub shell **14** even when the spacer **62** is broken.

(11) Since the supporting member **64** includes a non-metallic material, it is possible to prevent the spacer **62** from being removed from the hub shell **14** even when the spacer **62** is broken with suppressing an increase in weight of the bicycle hub assembly **10**.

(12) The sliding member **66** is provided between the sprocket support body **16** and the second ratchet member **28** in the axial direction **D1** parallel to the rotational axis **A1**. The sliding member **66** includes a non-metallic material. Accordingly, it is possible to reduce or prevent friction sound caused by direct contact between the sprocket support body **16** and the second ratchet member **28**.

(13) The sliding member **66** is provided between the first axial surface **86** and the second axial surface **88** in the axial direction **D1**. Accordingly, it is possible to reduce or prevent friction sound caused by direct contact between the first axial surface **86** and the second axial surface **88**.

(14) Since the sliding member **66** has an annular shape, it is possible to effectively reduce or prevent friction sound caused by direct contact between the sprocket support body **16** and the second ratchet member **28** with securing strength of the sliding member **66**.

(15) The second ratchet member **28** is provided between the first ratchet member **26** and the sliding member **66** in the axial direction **D1**. Accordingly, the sliding member **66** can receive an axial force applied from the first ratchet member **26** to the second ratchet member **28** in the axial direction **D1**.

(16) Since the sliding member **66** includes a non-metallic material, it is possible to reduce or prevent friction sound caused by direct contact between the sprocket support body **16** and the second ratchet member **28** with suppressing an increase in weight of the bicycle hub assembly **10**.

(17) The additional biasing member **68** is provided between the hub shell **14** and the second ratchet member **28** in the axial direction **D1** to bias the second ratchet member **28** toward the sprocket support body **16**. Accordingly, it is possible to stabilize an orientation of the second ratchet member **28** relative to the hub shell **14** by the additional biasing member **68**. This can reduce or prevent friction sound caused by direct contact between the hub shell **14** and the second ratchet member **28**.

(18) The additional biasing member **68** is provided radially outwardly of the biasing member **60**. Accordingly, it is possible to effectively stabilize the orientation of the second ratchet member **28** relative to the hub shell **14** by the additional biasing member **68**.

14

(19) The additional biasing member **68** is provided radially outwardly of the at least one second ratchet tooth **56**. Accordingly, it is possible to utilize a space provided radially outwardly of the at least one second ratchet tooth as a space in which the additional biasing member **68**.

(20) The additional biasing member **68** is provided between the hub shell **14** and the cylindrical element **90** in the axial direction **D1**. Accordingly, it is possible to effectively stabilize the orientation of the second ratchet member **28** relative to the hub shell **14** by the additional biasing member **68**.

(21) The supporting member **64** is provided between the second ratchet member **28** and the additional biasing member **68** in the axial direction **D1**. Accordingly, it is possible to stabilize an orientation of the additional biasing member **68** relative to the hub shell **14** by the supporting member **64**.

(22) The supporting member **64** includes the annular base **78** and the radially supporting portion **84**. Accordingly, it is possible to further stabilize an orientation of the additional biasing member **68** relative to the hub shell **14** by the supporting member **64**.

(23) Since the supporting member **64** includes a non-metallic material, it is possible to effectively stabilize the orientation of the additional biasing member **68** relative to the hub shell **14** by the supporting member **64** with suppressing an increase in weight of the bicycle hub assembly **10**.

(24) The receiving member **70** is provided between the first ratchet member **26** and the biasing member **60** in the axial direction **D1**. Accordingly, it is possible to stabilize an orientation of the biasing member **60** relative to the hub shell **14** by the receiving member **70**. This can stabilize a motion of the first ratchet member **26**, preventing uneven wear of at least one of the first ratchet member **26** and the second ratchet member **28**.

(25) Since the receiving member **70** is provided between the first receiving surface **92** and the biasing member **60** in the axial direction **D1**, it is possible to stabilize an orientation of the receiving member **70** relative to the first ratchet member **26**. This can stabilize the orientation of the biasing member **60** relative to the hub shell **14**. Accordingly, it is possible to effectively prevent uneven wear of at least one of the first ratchet member **26** and the second ratchet member **28**.

(26) Since the receiving member **70** is provided radially outwardly of the cylindrical part **94**, it is possible to further stabilize the orientation of the receiving member **70** relative to the first ratchet member **26**. This can further stabilize the orientation of the biasing member **60** relative to the hub shell **14**. Accordingly, it is possible to effectively prevent uneven wear of at least one of the first ratchet member **26** and the second ratchet member **28**.

(27) Since the radially receiving part **98** is provided between the cylindrical part **94** and the biasing member **60** in the radial direction perpendicular to the rotational axis **A1**, it is possible to further stabilize the orientation of the biasing member **60** relative to the hub shell **14**. Accordingly, it is possible to more effectively prevent uneven wear of at least one of the first ratchet member **26** and the second ratchet member **28**.

(28) Since the receiving member **70** includes a non-metallic material, it is possible to reduce or prevent wear of at least one of the biasing member **60** and the first ratchet member **26** with suppressing an increase in weight of the bicycle hub assembly **10**.

The term “comprising” and its derivatives, as used herein, are intended to be open ended terms that specify the pres-

15

ence of the stated features, elements, components, groups, integers, and/or steps, but do not exclude the presence of other unstated features, elements, components, groups, integers and/or steps. This concept also applies to words of similar meaning, for example, the terms “have”, “include” and their derivatives.

The terms “member”, “section”, “portion”, “part”, “element”, “body”, and “structure” when used in the singular can have the dual meaning of a single part or a plurality of parts.

The ordinal numbers such as “first” and “second” recited in the present application are merely identifiers, but do not have any other meanings, for example, a particular order and the like. Moreover, for example, the term “first element” itself does not imply an existence of “second element”, and the term “second element” itself does not imply an existence of “first element.”

The term “pair of”, as used herein, can encompass the configuration in which the pair of elements have different shapes or structures from each other in addition to the configuration in which the pair of elements have the same shapes or structures as each other.

Finally, terms of degree such as “substantially”, “about” and “approximately” as used herein mean a reasonable amount of deviation of the modified term such that the end result is not significantly changed.

Obviously, numerous modifications and variations of the present invention are possible in light of the above teachings. It is therefore to be understood that within the scope of the appended claims, the invention may be practiced otherwise than as specifically described herein.

What is claimed is:

1. A bicycle hub assembly comprising:
 - a hub axle defining a rotational axis;
 - a hub shell rotatably mounted on the hub axle to rotate about the rotational axis, the hub shell including at least one first tooth;
 - a sprocket support body rotatably mounted on the hub axle to rotate about the rotational axis, the sprocket support body including a first helical spline;
 - a first ratchet member comprising:
 - at least one first ratchet tooth; and
 - a second helical spline engaged with the first helical spline;
 - a second ratchet member comprising:
 - at least one second ratchet tooth engageable with the at least one first ratchet tooth; and
 - at least one second tooth engaged with the at least one first tooth; and
 - a sliding member provided between the sprocket support body and the second ratchet member in an axial direction parallel to the rotational axis, the sliding member including a non-metallic material.
2. The bicycle hub assembly according to claim 1, wherein
 - the sprocket support body includes a first axial surface facing in the axial direction,
 - the second ratchet member includes a second axial surface facing in the axial direction, and
 - the sliding member is provided between the first axial surface and the second axial surface in the axial direction.
3. The bicycle hub assembly according to claim 1, wherein
 - the sliding member has an annular shape.
4. The bicycle hub assembly according to claim 1, wherein

16

the second ratchet member is provided between the first ratchet member and the sliding member in the axial direction.

5. The bicycle hub assembly according to claim 1, wherein
 - the non-metallic material includes a resin material.
6. A bicycle hub assembly comprising:
 - a hub axle defining a rotational axis;
 - a hub shell rotatably mounted on the hub axle to rotate about the rotational axis, the hub shell including at least one first tooth;
 - a sprocket support body rotatably mounted on the hub axle to rotate about the rotational axis, the sprocket support body including a first helical spline;
 - a first ratchet member comprising:
 - at least one first ratchet tooth; and
 - a second helical spline engaged with the first helical spline;
 - a second ratchet member comprising:
 - at least one second ratchet tooth engageable with the at least one first ratchet tooth; and
 - at least one second tooth engaged with the at least one first tooth;
 - a biasing member provided between the hub shell and the first ratchet member in an axial direction parallel to the rotational axis to bias the first ratchet member toward the second ratchet member; and
 - an additional biasing member provided between the hub shell and the second ratchet member in the axial direction to bias the second ratchet member toward the sprocket support body.
7. The bicycle hub assembly according to claim 6, wherein
 - the additional biasing member is provided radially outwardly of the biasing member.
8. The bicycle hub assembly according to claim 6, wherein
 - the additional biasing member is provided radially outwardly of the at least one second ratchet tooth.
9. The bicycle hub assembly according to claim 6, wherein
 - the second ratchet member includes a cylindrical element extending in the axial direction,
 - the at least one second tooth extends radially outwardly from the cylindrical element, and
 - the additional biasing member is provided between the hub shell and the cylindrical element in the axial direction.
10. The bicycle hub assembly according to claim 6, further comprising:
 - a supporting member provided between the second ratchet member and the additional biasing member in the axial direction.
11. The bicycle hub assembly according to claim 10, wherein
 - the supporting member includes
 - an annular base provided between the second ratchet member and the additional biasing member in the axial direction, and
 - a radially supporting portion extending from the annular base in the axial direction, and
 - the additional biasing member is provided radially outwardly of the radially supporting portion.
12. The bicycle hub assembly according to claim 10, wherein
 - the supporting member includes a non-metallic material.

17

- 13.** A bicycle hub assembly comprising:
 a hub axle defining a rotational axis;
 a hub shell rotatably mounted on the hub axle to rotate about the rotational axis, the hub shell including at least one first tooth;
 a sprocket support body rotatably mounted on the hub axle to rotate about the rotational axis, the sprocket support body including a first helical spline;
 a first ratchet member comprising:
 at least one first ratchet tooth; and
 a second helical spline engaged with the first helical spline;
 a second ratchet member comprising:
 at least one second ratchet tooth engageable with the at least one first ratchet tooth; and
 at least one second tooth engaged with the at least one first tooth;
 a biasing member provided between the hub shell and the first ratchet member in an axial direction parallel to the rotational axis to bias the first ratchet member toward the second ratchet member; and
 a receiving member provided between the first ratchet member and the biasing member in the axial direction.
- 14.** The bicycle hub assembly according to claim **13**, wherein
 the first ratchet member includes a first receiving surface facing in the axial direction, and

18

- the receiving member is provided between the first receiving surface and the biasing member in the axial direction.
- 15.** The bicycle hub assembly according to claim **13**, wherein
 the first ratchet member includes a cylindrical part extending from the first receiving surface in the axial direction, and
 the receiving member is provided radially outwardly of the cylindrical part.
- 16.** The bicycle hub assembly according to claim **15**, wherein
 the receiving member includes
 an axially receiving part provided between the first receiving surface and the biasing member in the axial direction, and
 a radially receiving part extending from the axially receiving part in the axial direction, the radially receiving part being provided between the cylindrical part and the biasing member in a radial direction perpendicular to the rotational axis.
- 17.** The bicycle hub assembly according to claim **13**, wherein
 the receiving member includes a non-metallic material.
