(57) **ABSTRACT**

A power supply includes a bottom case, a top cover, a circuit board and a heat-dissipating fan. In this case, the bottom case and the top cover are fitted together to delimit an accommodating space. The circuit board is mounted on the bottom case and located within the accommodating space. The heat-dissipating fan includes a supporting frame, a driving module provided on the supporting frame, and a fan blade set covering the driving module and being driven by the driving module to rotate. The supporting frame is provided with a main body for the driving module and the fan blade set to be installed, as well as a plurality of supporting posts respectively connected to the main body and fixed on the circuit board, and the heat-dissipating fan is not provided with a barrier wall around the fan blade set.

FAN MOUNTING ARRANGEMENT IN A POWER SUPPLY

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a Continuation-in-Part of co-pending application Ser. No. 15/826,106, filed on Nov. 29, 2017, for which priority is claimed under 35 U.S.C. § 120; the entire contents of all of which are hereby incorporated by reference.

FIELD OF THE INVENTION

The present invention is related to a power supply, particularly to a power supply using a heat-dissipating fan without a barrier wall around a fan blade set.

BACKGROUND OF THE INVENTION

At present, each of all power supplies used in personal computers includes a fan for heat-dissipation. The general arrangement of the fan is disclosed in patents, such as US 2009/0290293, US 2010/0284149, US 2008/0266793, U.S. Pat. No. 6,074,296 and so on.

It may be clearly understood that, from patents listed above, each of all currently used fans is provided with an outer frame, via which the fan is mounted on a housing of the power supply. Additionally, a flow-guiding channel, provided for a fan blade set to be suspended therein, is further delimited by the outer frame, such that heat-dissipating airflow generated by the fan is discharged through the flow-guiding channel.

In this manner, although heat-dissipating airflow generated by the fan is collected, the heat-dissipating airflow is allowed to only dissipate heat locally in disguise without providing heat-dissipation for each element within the power supply effectively. Thus, effect of heat-dissipation is reduced.

On the other hand, the U.S. Pat. No. 5,478,221 discloses a miniature fan which is disposed on a circuit board via a supporting device. However, the configuration of the supporting device requires a specific assembly area to be laid out on the circuit board, and therefore in the case of today's high power density of power supply, it is difficult to provide a specific assembly area to configure the fan.

SUMMARY OF THE INVENTION

It is the main object of the present invention to solve the problem of reduced effect of heat-dissipation due to an outer frame generally provided for a fan used in a power supply.

For achieving the above object, the present invention provides a power supply, including a bottom case, a top cover, a circuit board and a heat-dissipating fan. The bottom case and the top cover are fitted together to delimit an accommodating space. The circuit board is mounted on the bottom case and located within the accommodating space. The circuit board is provided with a plurality of electronic components for forming a power supply circuit, the circuit board has a plurality of post mounting positions not disposed with the electronic components, and the post mounting positions are separated and at least one of the electronic components is located between any two of the post mounting positions. The heat-dissipating fan includes a supporting frame, a driving module provided on the supporting frame, and a fan blade set covering the driving module and being

2

driven by the driving module to rotate. The supporting frame is provided with a main body for the driving module and the fan blade set to be installed, as well as a plurality of supporting posts connected to the main body and fixed on the circuit board, respectively. The supporting frame is not provided with a barrier wall around the fan blade set. A height of the main body supported by the supporting posts is at least higher than the highest of the electronic components.

In one embodiment, the top cover is provided with at least one vent facing the heat-dissipating fan.

In one embodiment, each of the plurality of supporting posts and the main body are two members, which may be separated from each other.

In one embodiment, lines interconnecting positions where the mounting holes are located are formed as a polygon.

In one embodiment, the supporting frame is provided with a plurality of connecting ribs, each of the plurality of connecting ribs being respectively provided between two adjacent of the plurality of supporting posts.

In one embodiment, the main body at least has one flat portion for placing the driving module, a protruding portion connected to the flat portion and located at a center position of the main body for assembling the fan blade set, and a plurality of connecting portions respectively extending from an edge of the flat portion.

In one embodiment, each of the connecting portions has a first assembling hole, each of the supporting posts respectively has a second assembling hole facing one of the first assembling holes, and each of the first assembling holes as well as each of the second assembling holes allow an assembling element to be installed.

In one embodiment, the main body has a conduit connected to the flat portion for installing an electrical connection line to which the driving module belongs.

In comparison with the conventional art, the feature obtained by what is provided above in the present invention is as follows: the heat-dissipating fan disclosed in the present invention being not provided with a barrier wall around the fan blade set. In other words, the heat-dissipating fan of the present invention is not provided with an outer frame. Thus, the heat-dissipating airflow generated by the heat-dissipating fan is not restricted by the outer frame any more in the present invention, while heat dissipation in relation to each of the plurality of electronic components or member within the accommodating space is allowed so as to further enhance effect of heat-dissipation in comparison with the conventional art. On the other hand, the heat-dissipating fan of the present invention is not provided with an outer frame so as to decrease the noise produced by the heat-dissipating fan from working. In addition, since the configuration of the heat-dissipating fan of the present invention does not require a specific assembly area to be laid out on the circuit board, it can be specifically applied inside the power supply structure of today's high power density.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an exploded diagram of a power supply of one embodiment of the present invention.

FIG. 2 is an exploded diagram of a partial structure of the power supply of the embodiment of the present invention.

FIG. 3 is a structural cross-section view of the power supply of the embodiment of the present invention.

FIG. 4 is a structural cross-section view of a power supply of another embodiment of the present invention.

3

FIG. 5 is a top view of a partial structure of a power supply of one embodiment of the present invention.

FIG. 6 is an exploded diagram of a partial structure of a power supply of another embodiment of the present invention.

FIG. 7 is a structural cross-section view of the power supply of another embodiment of the present invention.

FIG. 8 is a top view of a partial structure of a power supply of another embodiment of the present invention.

FIG. 9 is an exploded diagram of a structure of a power supply of another embodiment of the present invention.

FIG. 10 is an exploded diagram of a top cover of another embodiment of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The detailed description and technical content related to the present invention is described in accompany with the drawings as follows.

Referring to FIG. 1, FIG. 2, FIG. 3, FIG. 4, FIG. 5, the present invention provides a power supply 10. The power supply 10 may be implemented according to the ATX specification. The power supply 10 includes a bottom case 11, a top cover 12, a circuit board 13 and a heat-dissipating fan 14. In this case, the bottom case 11 and the top cover 12 may be presented in the form of a mutually fitted structure. In one embodiment, each of the bottom case 11 and the top cover 12 is formed as U-shaped structure, respectively, such that the bottom case 11 and the top cover 12 are fitted together to delimit an accommodating space 15. Further, the top cover 12 may be provided with a vent 121. Next, in the present invention, the bottom case 11 and the top cover 12 may be implemented with many components according to the design. Furthermore, the bottom case 11 may be further mounted at the sides thereof with a power input port 111 and at least one power output port 112. The power input port 111 and the power output port 112 are provided at different sides of the bottom case 11. The number of the power output ports 112 may be modified as required for implementation.

Next, the circuit board 13 is mounted on the bottom case 11 and located within the accommodating space 15. The circuit board 13 is laid thereon with a plurality of electronic components 131 and a plurality of heat-dissipating elements 132, each of the plurality of heat-dissipating elements 132 being provided correspondingly to one of the plurality of electronic components 131, respectively. In this case, the plurality of electronic components 131 are combined as at least a power calibration circuit, an electric power conversion circuit and etc., after being arranged. Further, each of plurality of the heat-dissipating elements 132 is contacted with one of the plurality of electronic components 131, to which each of the plurality of heat-dissipating elements 132 is provided correspondingly, so as to conduct heat. Each of the plurality of heat-dissipating elements 132 is provided with a mounting hole 133. In one embodiment, the plurality of heat-dissipating elements 132 are of equal height, in such a way that top edges 134 of the plurality of heat-dissipating elements 132 are located on overlapping parallel lines 60. Moreover, each of the mounting holes 133 is located on the top edge 134 of each of the plurality of heat-dissipating elements 132, respectively. Furthermore, the mounting hole 133 referred to in the present invention may be replaced by a gap 136 formed between a plurality of fins 135 on the plurality of heat-dissipating elements 132, just as illustrated in FIG. 2.

4

Furthermore, the heat-dissipating fan 14 of this embodiment includes a supporting frame 141, a driving module 142 provided on the supporting frame 141, and a fan blade set 143 covering the driving module 142 and being driven by the driving module 142 to rotate. The heat-dissipating fan 14 is further connected to a power feeder (not illustrated in this figure) on the circuit board 13 via a power line 144, so as to acquire electric power required for rotation. Further, the driving module 142 is implemented as an electric motor configuration. Additionally, the supporting frame 141 of the present invention is presented as a flat plate and provided with a plurality of connecting ribs 145, each of the plurality of connecting ribs 145 being connected to one of the mounting holes 133, respectively. The pattern of each of the plurality of connecting ribs 145 may be modified in accordance with the position or pattern of each of the plurality of heat-dissipating elements 132 on which the mounting hole 133 is provided. Further, the heat-dissipating fan 14 of the present invention is not provided with a barrier wall, which is provided around the fan blade set 143. In other words, the heat-dissipating fan 14 is not provided with a flow-limiting channel, which is delimited by an outer frame and in which the fan blade set 143 is suspended. In this way, the heat-dissipating fan 14 is allowed for generating heat-dissipating airflow within the accommodating space 15 more specifically when operated electrically, so as to enhance the heat-dissipation performance.

In one embodiment, referring to FIG. 5, for the enhancement of stability of the heat-dissipating fan 14 during rotation, the mounting holes 133 may be mapped out, such that a polygon 61 is formed by lines interconnecting positions where the mounting holes 133 are located. In this way, the heat-dissipating fan 14 may be supported more stably, so as to reduce the possibility of sway of the heat-dissipating fan 14 during rotation. Nevertheless, the amount of the mounting hole 133 used in the embodiment of the present invention may be, for example but not limited to, three. Other appropriate amount of the mounting hole 133 is also applicable in the present invention.

Referring to FIG. 6, FIG. 7 and FIG. 10, another embodiment is also proposed, besides the above power supply 10, in the present invention. Different numerals are used below, however, for distinguishing between the two embodiments. In this embodiment, the power supply 20 includes a bottom case 21, a top cover 22, a circuit board 23 and a heat-dissipating fan 24. In this case, the bottom case 21 and the top cover 22 are fitted together to delimit an accommodating space 25. The top cover 22 may be provided with at least one vent 221 facing the heat-dissipating fan 24. Further, the circuit board 23 is mounted on the bottom case 21 and located within the accommodating space 25. The circuit board 23 is laid with a plurality of electronic components 231 and the plurality of heat-dissipating elements 232 as required for implementation. The electronic components 231 are configured to form at least one power supply circuit including a power calibration circuit, an electric power conversion circuit, etc. Moreover, the plurality of heat-dissipating elements 232 may be laid as required for implementation. On the other hand, the circuit board 23 has a plurality of post mounting positions 235 at which the electronic components 231 are not disposed. The post mounting positions 235 are separated, and at least one of the electronic components 231 is located between any two of the post mounting positions 235. Specifically, the post mounting positions 235 in the present invention refer to gaps between the electronic components 231 after the circuit board 23 is completed with the circuit layout of the power supply

circuit, and therefore, at least one of the electronic components 231 is allowed to be disposed between the post mounting positions 235.

Further, the heat-dissipating fan 24 includes a supporting frame 241, a driving module 242 provided on the supporting frame 241, and a fan blade set 243 covering the driving module 242 and being driven by the driving module 242 to rotate. In this embodiment, the supporting frame 241 is provided with a main body 244 provided for the driving module 242 and the fan blade set 243 to be installed, as well as a plurality of supporting posts 245 connected to the main body 244 and fixed on the circuit board 23, respectively. More specifically, the main body 244 is presented as a flat plate. The main body 244 is provided with at least a flat portion 246 provided for the driving module 242 to be placed, as well as a protruding portion 247 connected to the flat portion 246 and located at the center of the main body 244 for the fan blade set 243 to be fitted. In one embodiment, the main body 244 further includes a plurality of connecting portions 248 extending from the edge of the flat portion 246, respectively. Each of the connecting portions 248 is respectively corresponded to one of the plurality of supporting posts 245. Each of the connecting portions 248 has a first assembling hole 270, each of the supporting posts 245 respectively has a second assembling hole 271 facing one of the first assembling holes 270, and each of the first assembling holes 270 as well as each of the second assembling holes 271 allow an assembling element 28 to be installed. In one embodiment, the main body 244 has a conduit 240 connected to the flat portion 246 for installing an electrical connection line 29 to which the driving module 242 belongs.

Next, the circuit board 23 is provided with a plurality of through-holes 233 that are disposed at one of the post mounting positions 235 for the plurality of supporting posts 245 to be installed, respectively. Moreover, the main body 244 is held up by the plurality of supporting posts 245 together, such that the main body 244 is installed at a height 62 relative to the circuit board 23, in which each of the plurality of supporting posts 245 is at least higher than the highest one of the electronic components 231. In other words, a height of the main body 244 supported by the supporting posts 245 is at least higher than the highest of the electronic components 231. Moreover, each of the plurality of supporting posts 245 and the main body 244 are two members, which may be separated from each other. Furthermore, the heat-dissipating fan 24 of this embodiment is not provided with a barrier wall, which is provided around the fan blade set 243; that is to say, the heat-dissipating fan 24 is not provided with a flow-limiting channel, which is delimited by an outer frame and in which the fan blade set 243 is suspended. Further, a projection of the heat-dissipating fan 24 facing the circuit board 23 will cover the electronic components 231 constituting the power supply circuit.

In one embodiment, referring to FIG. 7 and FIG. 8, for the enhancement of stability of the heat-dissipating fan 24 during rotation, the positions where the plurality of supporting posts 245 are located on the circuit board 23 may be mapped out, such that a polygon 63 is formed by lines interconnecting positions where the plurality of supporting posts 245 are located on the circuit board 23. Nevertheless, the amount of the supporting post 245 used in the embodiment may be, for example but not limited to, three. Other appropriate amount of the supporting post 245 is also applicable in the present invention. Furthermore, a fixing component 30 is further implemented with each of the plurality of supporting posts 245, and fixing each of the

plurality of supporting posts 245 on the circuit board 23, wherein the fixing component 30 may be a nut, a screw, and so on. In addition, referring to FIG. 9, the supporting frame 241 in one embodiment may be provided with a plurality of connecting ribs 249, each of the plurality of connecting ribs 249 being provided between two adjacent of the plurality of supporting posts 245, respectively. The plurality of connecting ribs 249 may be provided for enhancing the structural strength of the plurality of supporting posts 245. The pattern of the plurality of connecting ribs 249 may be modified as required for implementation.

Additionally, the top cover 22 is provided thereon with at least one vent 221 facing the heat-dissipating fan 24. In one embodiment, the top cover 22 is provided thereon with the vents 221, and the vents 221 may be laid out and then formed in accordance with a designed pattern. In addition, it is also possible to modify the opening area of the vent 221 provided on the top cover 22 as required for implementation, such that the vent 221 may be provided for a decorative baffle 26 to be installed therein. The decorative baffle 26 may be provided with a plurality of air-permeable holes 261, which are cuttngly provided in accordance with a designed pattern, just as illustrated in FIG. 10. In this embodiment, moreover, the power supply 20 is provided for a user with a choice among a variety of the decorative baffles 26 on the basis of personal preference.

What is claimed is:

1. A power supply, comprising:

a bottom case and a top cover, said bottom case and said top cover being fitted together to delimit an accommodating space;

a circuit board, mounted on said bottom case and located within said accommodating space, said circuit board being provided with a plurality of electronic components for forming a power supply circuit, said circuit board comprising a plurality of post mounting positions not disposed with said plurality of electronic components, and said plurality of post mounting positions being separated and at least one of said plurality of electronic components being located between any two of said plurality of post mounting positions; and

a heat-dissipating fan, including a supporting frame, a driving module provided on said supporting frame, and a fan blade set covering said driving module and being driven by said driving module to rotate, said supporting frame being provided with a main body for said driving module and said fan blade set to be installed, as well as a plurality of supporting posts connected to said main body and fixed on said circuit board, respectively, said supporting frame being not provided with a barrier wall around said fan blade set, and a height of said main body supported by said a plurality of supporting posts being at least higher than the highest of said plurality of electronic components.

2. The power supply according to claim 1, wherein said top cover is provided with at least one vent facing said heat-dissipating fan.

3. The power supply according to claim 1, wherein each of the plurality of supporting posts and said main body are two members, which may be separated from each other.

4. The power supply according to claim 3, wherein lines interconnecting positions where said plurality of supporting posts are located on said circuit board are formed as a polygon.

5. The power supply according to claim 4, wherein said supporting frame is provided with a plurality of connecting

ribs, each of the plurality of connecting ribs being respectively provided between two adjacent of the plurality of supporting posts.

6. The power supply according to claim 1, wherein said main body at least comprise one flat portion for placing said driving module, a protruding portion connected to said flat portion and located at a center position of said main body for assembling said fan blade set, and a plurality of connecting portions respectively extending from an edge of said flat portion.

7. The power supply according to claim 6, wherein each of said plurality of connecting portions comprises a first assembling hole, each of said plurality of supporting posts respectively comprises a second assembling hole facing one of said first assembling holes, and each of said first assembling holes as well as each of said second assembling holes allow an assembling element to be installed.

8. The power supply according to claim 6, wherein said main body comprises a conduit connected to said flat portion for installing an electrical connection line to which said driving module belongs.

* * * * *
